1. Where we use arithmetic operators in devops:-

In devops, arithmetic operators are mainly used in shell scripting (bash) automation scripts, and CI/CD pipelines to perform calculations.

Common use cases:-

1. Loop counters:- count the no of iterations

~ Bash

```
count=$((count+1))
```

2. File or log counting:- count the no of files or log entries

```
files=$((ls | wc -l))
```

```
echo "Total files: $files"
```

3. Disk and memory calculations:- Check available disk space or memory usage

```
used=$((total - free))
```

4. Retry logic:- increase the retry count when a command fails

```
retry=$((retry+1))
```

5. CI/CD pipelines:- increment build number or version numbers

~ Bash

```
build=$((build+1))
```

```
echo "Build number: $build"
```
